

(A) VARIABLES NOTED WITH SUBSCRIPT 'S' CORRELATE TO THE SPACECRAFT, AND 'P' TO THE PLANET.

THESE VALUES ARE ALL FROM AFTER PERFORMING THE ORBITAL INJECTION MANEUVER.

(B) ARCTAN(X) SENDS TO THE FIRST AND FOURTH QUADRANT, SO WE HAVE TO PUSH SOME OF THE VALUES BY HALF A ROTATION:

(C) $\hat{r} \times \vec{v}_\theta$ → $\vec{v}_\theta^{(out)}$ (THIS VECTOR WILL GO OUT (POSITIVE) IF $\vec{v}_\theta$ GOES TO THE LEFT, AND IN (NEGATIVE) OTHERWISE)

(BECAUSE OF THE RIGHT HAND RULE)

(F) THE PROCESS OF COMPUTING A SINGLE ORBIT CAN BE REPEATED TO CHECK IF THE ORBIT IS STABLE.
